Processing of data in many data analysis applications can be represented as a coarse grain data flow, from data sources to the client. This paper is concerned with the scheduling of multiple data analysis operations, each of which is represented as a task.

There is an increased use of software in safety-critical systems; a trend that is expected to continue in the future. Although traditional system safety techniques are well suited to safety intensive systems, there are new challenges emerging. In this paper, we discuss some of these challenges and propose a framework for addressing them.

January 2002 **POPL '02**: Proceedings of the 29th ACM SIGPLAN-SIGACT symposium on Principles of programming languages

Publisher: ACM

Full text available: Pdf (473.78 KB) Additional Information: [full citation](#), [abstract](#), [references](#)

Bibliometrics: Downloads (6 Weeks): 16, Downloads (12 Months): 67, Citation

We introduce a general uniform language-independent framework for design and offline source-to-source program transformations by abstract interpretation and program semantics. Iterative source-to-source program transformations are constructed constructively ...
